

ABSTRACT OF THE DISCLOSURE:

The present invention provides: a toner for developing electrostatic images including as a main component thereof a binder resin having a copolymer comprised of a combination of a high Tg monomer having a structure represented by the following structural formula (1) and a glass transition temperature of 50°C or higher, a low Tg monomer having a structure represented by the following structural formula (2) and a glass transition temperature of lower than 50°C, and a hydrophilic monomer having a structure represented by the following structural formula (3); a process for preparing the toner for developing electrostatic images; a developer for developing electrostatic images containing the toner; and an image forming method using the toner.
